

Prince Kaushal — Projects and Experience

Pryaxis Website

Prince built the official website for Pryaxis, the AI automation and web design agency he co-founded. The site was built using React and Vite for fast development and a modern single-page application structure, styled with a dark theme and subtle three dimensional elements to give it a premium, modern feel. The goal of the project was to showcase Pryaxis's services to potential clients and make a strong first impression through design quality rather than generic templates.

Wedding Invitation Website

As a client project through Pryaxis, Prince designed and developed an interactive wedding invitation website featuring a peacock animation sequence spread across four slides. The project combined custom animation work with a smooth, guided user flow so that guests experienced the invitation like a short interactive story rather than a static page. This project demonstrated Prince's ability to turn a creative, non-technical brief into a polished technical build.

Personal Portfolio Website

Prince built his own personal portfolio as a React and Vite single-page application with a dark, three dimensional visual style. The portfolio is currently being restyled to better reflect his evolving design taste and to serve as a stronger showcase piece when applying for AI engineering and web development roles.

AI Voice Calling Agent (Personal Project)

Outside of client work, Prince has been building a personal project: an AI voice calling agent with its own custom user interface, rather than relying on a third-party voice platform. The project is intended primarily as a portfolio piece to demonstrate applied AI engineering skills, including handling real-time voice interaction logic end to end.

Internship and Work Experience

Prince has worked part time in a role involving roughly eight hours per week of contribution, giving him experience balancing focused technical work alongside running his own agency. This experience helped him develop discipline around prioritizing tasks and delivering consistent progress even with limited hours available.

Achievements

Prince co-founded and helped grow Pryaxis from an idea into an operating agency with real client projects, which he considers one of his proudest achievements. He has also consistently pushed himself to learn new frameworks and tools independently, staying current with fast-moving trends in web design and AI without waiting for formal training.

Goals

Prince is currently focused on transitioning into a remote AI engineer role and is actively studying machine learning, retrieval-augmented generation systems, and related AI engineering concepts to strengthen his technical foundation. His goal is to combine his existing frontend and product sense with deeper AI engineering skills to build more sophisticated, intelligent applications.
